Solutions for Your Smile

Restore your smile to a more natural look

Your dentist can replace old, broken-down metal fillings or missing teeth that detract from your smile using ceramic, composite or fiber-reinforced composites.

Composite or ceramic restorations look natural because shades are selected to match the color of your teeth. These restorations are kind to your opposing teeth, wear more like natural enamel and can regain most of your tooth's original strength.

If you are missing teeth, a conservative fiber-reinforced bridge may be used to replace them. This proven composite fiber technology is completely biocompatible and metal-free. Ask your dentist which option would be best for you.

High strength fibers and resin create a strong substructure. Composite is layered over the substructure to recreate your natural tooth color and shape.

Composite or Ceramic Inlays and Onlays

Replace Old Metal Fillings

Fiber-Reinforced Composite

Replace an Anterior Tooth

Replace a Posterior Tooth
